To maintain system health, filters are placed at strategic locations:

- Suction Filter: Protects the pump from debris.
- Return Line Filter: Traps contaminants before fluid returns to the tank.

Proper filtration prolongs component life and maintains system efficiency.

6. Auxiliary Components

Additional components include:

- Hydraulic Accumulators: Dampen pressure spikes and store energy.
- Temperature Sensors: Monitor fluid temperature to prevent overheating.
- Hydraulic Hoses and Fittings: Ensure secure and leak-free fluid transfer.

Understanding the Hydraulic Circuit Flow

The hydraulic diagram provides a detailed pathway of fluid flow, which can be generally segmented into the following stages:

1. Power Generation and Distribution

- The engine drives the hydraulic pump.
- The pump creates pressurized hydraulic fluid.
- Fluid exits the pump via a high-pressure line.

2. Control and Regulation

- The pressurized fluid flows into control valves.
- Operator inputs (via joystick or foot pedals) actuate these valves.
- Valves direct fluid to specific cylinders/motors based on operational needs.

3. Actuator Operation

- Fluid reaches the hydraulic cylinders or motors.
- The fluid pressure causes pistons or rotors to move, executing the desired machine action.
- Return fluid flows back through the return lines.

4. Return and Filtration

- Hydraulic fluid returns to the reservoir.
- Passes through filters to remove debris.
- Is cooled if necessary, then re-enters the system for reuse.
