Sample Questions and Solutions from Chapter 23

Question 1: Calculating Enthalpy Change

Sample Problem:

Calculate the enthalpy change (ΔH) for the combustion of methane (CH_4) given the following data:

- $\Delta H^\circ_f (\text{CH}_4) = -74.8 \text{ kJ/mol}$
- $\Delta H^\circ_f (\text{CO}_2) = -393.5 \text{ kJ/mol}$
- $\Delta H^\circ_f (\text{H}_2\text{O}) = -241.8 \text{ kJ/mol}$

Solution:

Using the standard enthalpy of formation, the combustion reaction is:

Applying Hess's Law:

$$\Delta H = [\Delta H^\circ_f (\text{CO}_2) + 2 \times \Delta H^\circ_f (\text{H}_2\text{O})] - [\Delta H^\circ_f (\text{CH}_4)]$$

$$\Delta H = [(-393.5) + 2 \times (-241.8)] - (-74.8)$$

$$\Delta H = (-393.5 - 483.6) + 74.8$$

$$\Delta H = -877.1 + 74.8 = -802.3 \text{ kJ}$$

Answer:

The enthalpy change for the combustion of methane is approximately -802.3 kJ.

Question 2: Applying Le Châtelier's Principle

Sample Problem:

Predict the shift in equilibrium when additional N_2 gas is added to the following reaction:

Solution:

According to Le Châtelier's Principle, adding more N_2 will shift the equilibrium to the right to consume the added N_2 . This results in increased production of NH_3 and a shift toward the formation of ammonia.

Answer:

The equilibrium shifts to the right, favoring the formation of more NH_3 .

Question 3: Reaction Kinetics ? Rate Law Determination

Sample Problem:

Determine the rate law for the reaction based on the following data:

- When $[\text{A}] = 0.1 \text{ M}$, rate = 2.0 M/s
- When $[\text{A}] = 0.2 \text{ M}$, rate = 8.0 M/s

Solution:

Assuming the rate law is $\text{rate} = k [\text{A}]^n$,

Using data:

$$(8.0) / (2.0) = (0.2 / 0.1)^n$$

$$4 = (2)^n$$

$$n = 2$$

Answer:

The rate law is $\text{rate} = k [\text{A}]^2$.

Pearson Chemistry Guided Practice Problem 14: An In-Depth Exploration

In the realm of chemistry education, guided practice problems serve as essential tools for students to develop a deeper understanding of complex concepts. Among these, Pearson Chemistry Guided Practice Problem 14 stands out as a significant example, designed to challenge students' grasp of fundamental principles while fostering analytical thinking. This article aims to dissect this particular problem comprehensively, providing clarity on its purpose, methodology, and broader educational implications.

Understanding the Context of Pearson Chemistry Guided Practice Problems

Before delving into Problem 14 specifically, it's crucial to appreciate the role of guided practice within chemistry curricula. These problems are crafted to bridge the gap between theoretical knowledge and practical application, often integrating multiple concepts such as stoichiometry, atomic structure, chemical reactions, and thermodynamics.

In Pearson's approach, guided practice problems typically follow a structured format:

- Clear problem statement
- Step-by-step hints or prompts
- Opportunities for students to apply concepts actively
- Solutions or answer keys for self-assessment

This pedagogical strategy encourages active learning, helping students to build confidence and mastery over challenging topics.

Overview of Pearson Chemistry Guided Practice Problem 14

While the exact wording of Problem 14 can vary depending on the edition, it generally pertains to core topics in chemistry such as mole calculations, balancing chemical equations, or analyzing reaction mechanisms. For illustrative purposes, consider an example problem along these lines:

"Calculate the mass of aluminum oxide (Al_2O_3) produced when 50 grams of aluminum (Al) reacts completely with oxygen (O_2)."

This problem encapsulates several key concepts:

- Stoichiometry
- Limiting reactants
- Mass-to-mole conversions

By exploring this problem, students can refine their skills in interpreting chemical equations and performing quantitative analyses.

Breaking Down the Problem: Step-by-Step Approach

- Identify the Relevant Chemical Equation

The first step involves writing the balanced chemical reaction:

This equation indicates that 4 moles of aluminum react with 3 moles of oxygen to produce 2 moles of aluminum oxide.

- Convert Given Quantities to Moles

Given: 50 grams of aluminum.

Using the molar mass of aluminum (Al ? 26.98 g/mol):

$$\text{Moles of Al} = \frac{50 \text{ g}}{26.98 \text{ g/mol}} \approx 1.85 \text{ mol}$$

- Determine the Moles of Aluminum Oxide Produced

From the balanced equation, the molar ratio of Al to Al₂O₃ is 4:2, which simplifies to 2:1.

Thus:

$$\text{Moles of Al}_2\text{O}_3 = \frac{1.85 \text{ mol Al}}{2} \times 1 = 0.925 \text{ mol}$$

- Convert Moles of Aluminum Oxide to Mass

The molar mass of Al₂O₃:

$$(2 \times 26.98) + (3 \times 16.00) = 101.96 \text{ g/mol}$$

Therefore:

$$\text{Mass of Al}_2\text{O}_3 = 0.925 \text{ mol} \times 101.96 \text{ g/mol} \approx 94.4 \text{ g}$$

Final Answer: Approximately 94.4 grams of aluminum oxide are produced.

Educational Significance and Learning Outcomes

Enhancing Quantitative Skills

By engaging with problems like this, students sharpen their ability to:

- Convert between grams and moles accurately
- Interpret and balance chemical equations
- Apply stoichiometric ratios systematically
