- Specify the size and shape of the raw material (stock) that will be machined.
- Use stock models that match your actual raw parts to facilitate realistic simulation and collision

detection.

Step 3: Creating Tool Libraries

- Build a comprehensive library of cutting tools, including end mills, drills, reamers, and specialty tools.
- Define parameters such as tool diameter, length, flute length, and holder dimensions.

Step 4: Developing Machining Strategies

The heart of NX 9 CAM lies in creating effective strategies for removing material efficiently while maintaining part quality.

Common Machining Strategies:

- Facing: For initial flattening and surface finishing.
- Pocket Milling: For interior features and pockets.
- Contour/Profiling: For perimeter cuts and detailed edges.
- Drilling & Reaming: For hole creation.
- Swarfing & Tapping: For threads and complex features.
- High-Speed Machining (HSM): For optimizing feeds and speeds in high-performance operations.
- Multi-Axis Machining: For complex geometries, including 3+2 and full 5-axis operations.

Creating a Strategy:

- Select the geometry to machine.
- Choose the appropriate tool and parameters.
- Configure cutting parameters such as feed rates, spindle speeds, step-over, step-down, and cutting directions.
- Use the simulation tools to verify the operation.

Step 5: Using Knowledge-Based Machining (KBM)

NX 9's KBM allows for automation based on predefined rules and machining knowledge.

- Create templates for common operations to speed up repetitive tasks.

- Define rules for tool engagement, speeds, and feeds based on material and tool type.
- Apply these templates across multiple parts to ensure consistency.

Simulation and Verification of Toolpaths

Simulation is a critical stage to prevent collisions and ensure the correctness of your toolpaths.

Collision Detection

- Use the collision checking tools within NX 9 to identify potential interferences between the tool, holder, fixtures, and part.
- Adjust toolpaths or fixtures accordingly.

Material Removal Simulation

- Visualize the actual material removal process to confirm efficient machining.
- Detect areas where excess material remains or where toolpaths may cause gouging.

Post-Processing

- Convert digital toolpaths into machine-specific G-code using appropriate post-processors.
- NX 9 supports a comprehensive library of post-processors, or you can customize one for your specific machine.

Optimizing Your CAM Workflow

Efficiency in CAM programming is achieved through best practices and strategic planning.

Tips for Improved Productivity

- Reuse Operations: Save common strategies as templates to accelerate future projects.
- Automate with Macros: Use scripting to automate repetitive tasks.
- Prioritize Roughing: Focus on removing bulk material efficiently before finishing passes.
- Layered Approach: Use multiple passes with different tools and strategies for complex geometries.
- Leverage Multi-Axis Capabilities: For intricate shapes, employing 3+2 or full 5-axis machining reduces setup time and improves accuracy.

Regular Software Updates and Training

- Keep NX 9 updated with the latest patches to access new features and improvements.
- Invest in training sessions or tutorials to deepen your understanding of advanced features.
