Common Questions and Model Answers in Heinemann Biology Unit 1

1. Describe the structure of a typical plant cell and explain its functions.

Model Answer:

A typical plant cell has a rigid cell wall made of cellulose, providing structural support. Inside, it contains a cell membrane, cytoplasm, nucleus, chloroplasts, mitochondria, and a large central vacuole. The nucleus controls cell activities and contains genetic material. Chloroplasts enable photosynthesis, converting light energy into chemical energy. Mitochondria generate energy through respiration, while the vacuole maintains turgor pressure and stores nutrients.

2. How do enzymes work, and why are they important in biological reactions?

Model Answer:

Enzymes are biological catalysts that speed up chemical reactions by lowering activation energy. They have specific active sites that bind to substrates, forming enzyme-substrate complexes. This specificity ensures reactions occur efficiently under mild conditions. Enzymes are vital for processes like digestion, respiration, and DNA replication, ensuring life processes proceed swiftly and effectively.

3. Explain the difference between prokaryotic and eukaryotic cells.

Model Answer:

Prokaryotic cells are simple, lacking a nucleus and membrane-bound organelles, and are usually smaller (e.g., bacteria). Eukaryotic cells are more complex, with a defined nucleus and various organelles such as mitochondria and chloroplasts (e.g., plant and animal cells). These structural differences reflect their functional diversity and complexity.
