### MATLAB Codes for Microstrip Transmission Line: An In-Depth Review

Microstrip transmission lines are fundamental components in microwave and RF circuit design, widely used in antennas, filters, couplers, and other high-frequency devices. Their simple planar structure and compatibility with printed circuit board (PCB) manufacturing make them highly attractive. To analyze, design, and optimize these transmission lines effectively, engineers rely heavily on simulation tools like MATLAB. This article explores the MATLAB codes associated with microstrip transmission lines, delving into their theoretical foundations, implementation details, and practical applications.

## Understanding Microstrip Transmission Lines

Before diving into MATLAB coding, it's essential to understand what microstrip transmission lines are and their key parameters.

## What is a Microstrip Transmission Line?

A microstrip transmission line consists of a conducting strip separated from a ground plane by a dielectric substrate. It guides electromagnetic waves with a characteristic impedance and propagates signals with specific attenuation and phase velocity.

## Key Parameters of Microstrip Lines

- Width (W): Width of the conducting strip.
- Substrate height (h): Distance between the strip and the ground plane.
- Dielectric constant ( $\epsilon_r$ ): Relative permittivity of the substrate material.
- Effective dielectric constant ( $\epsilon_{eff}$ ): Accounts for fringing fields.
- Characteristic impedance ( $Z_0$ ): Impedance of the transmission line.
- Propagation constant ( $\gamma$ ): Describes attenuation and phase shift.
- Wavelength ( $\lambda$ ): Wavelength of signals in the medium.

## Theoretical Foundations for MATLAB Coding

To develop MATLAB codes, one must understand the analytical models that describe microstrip line behavior.

## Empirical and Analytical Models

- Hammerstad and Jensen Model: Widely used for calculating characteristic impedance and effective dielectric constant.
- Hammerstad's Formulas: Provide closed-form expressions for  $W/h$  and  $Z_0$ .
- Transmission Line Theory: Uses ABCD matrices and S-parameters for circuit analysis.

## Core Equations

- Effective dielectric constant ( $\epsilon_{eff}$ ):

For  $W/h \gg 1$ ,

$\epsilon_{eff} \approx \epsilon_r \frac{W + h}{W}$

$$\epsilon_{\text{eff}} = \frac{\epsilon_r + 1}{2} + \frac{\epsilon_r - 1}{2} \left(1 + 12 \frac{h}{W}\right)^{-0.5}$$

\\

For  $W/h \geq 1$ ,

\\

$$\epsilon_{\text{eff}} = \frac{\epsilon_r + 1}{2} + \frac{\epsilon_r - 1}{2} \left(1 + 12 \frac{h}{W}\right)^{-0.5}$$

\\

(same formula applies generally, with correction factors for different  $W/h$  ratios.)

- Characteristic impedance ( $Z_0$ ):

For  $W/h \geq 1$ ,

\\

$$Z_0 = \frac{60}{\sqrt{\epsilon_{\text{eff}}}} \ln \left(8 \frac{h}{W} + 0.25 \frac{W}{h}\right)$$

\\

For  $W/h \geq 1$ ,

\\

$$Z_0 = \frac{120\pi}{\sqrt{\epsilon_{\text{eff}}}} \left( \frac{W}{h} + 1.393 + 0.667 \ln \left( \frac{W}{h} + 1.444 \right) \right)^{-1}$$

\\

## Implementing MATLAB Codes for Microstrip Line Analysis

Developing MATLAB scripts involves translating these formulas into code, enabling quick calculations and parametric studies.

### Step 1: Define Input Parameters

Set the key parameters such as dielectric constant, substrate height, and desired characteristic impedance.

```
```matlab

% Example input parameters

epsilon_r = 4.4; % Dielectric constant

h = 1.6e-3; % Substrate height in meters (e.g., 1.6 mm)

Z0_target = 50; % Desired characteristic impedance in ohms

```
```

## Step 2: Calculate W for Given Z0 or vice versa

Implement functions to compute W given Z0,  $\epsilon_r$ , h, or to compute Z0 for a given W.

```
```matlab

% Function to compute effective dielectric constant

function epsilon_eff = calc_epsilon_eff(epsilon_r, W, h)

W_h_ratio = W/h;

epsilon_eff = (epsilon_r + 1)/2 + (epsilon_r - 1)/2 (1 + 12/W_h_ratio)^-0.5;

end

% Function to compute characteristic impedance

function Z0 = calc_Z0(epsilon_eff, W, h)

W_h_ratio = W/h;

if W_h_ratio
Z0 = (60 / sqrt(epsilon_eff)) log(8W/h + 0.25W/h);

else
```

```
Z0 = (120pi / sqrt(epsilon_eff)) / (W/h + 1.393 + 0.667log(W/h + 1.444));
```

```
end
```

```
end
```

```
```
```

Note: For inverse calculations (finding  $W$  for a target  $Z_0$ ), iterative algorithms like Newton-Raphson or bisection methods are employed.

### Step 3: Parametric Sweeps and Visualization

Allows users to analyze how  $W$  and other parameters affect line behavior.

```
```matlab
```

```
W_vals = linspace(0.1e-3, 3e-3, 100); % W from 0.1mm to 3mm
```

```
Z0_vals = zeros(size(W_vals));
```

```
epsilon_eff_vals = zeros(size(W_vals));
```

```
for i = 1:length(W_vals)
```

```
    epsilon_eff_vals(i) = calc_epsilon_eff(epsilon_r, W_vals(i), h);
```

```
    Z0_vals(i) = calc_Z0(epsilon_eff_vals(i), W_vals(i), h);
```

```
end
```

```
figure;
```

```
plot(W_vals1e3, Z0_vals);
```

```
xlabel('Microstrip Width W (mm)');
```

```
ylabel('Characteristic Impedance Z_0 (Ohms)');
```

```
title('W vs Z_0 for Microstrip Line');
```

grid on;

```

While analytical formulas provide initial estimates, they often fall short for complex geometries or specific performance criteria. Electromagnetic simulation tools like HFSS are essential for accurate modeling and optimization.

Benefits of Using HFSS for Microstrip Antenna Design:

- Accurate 3D electromagnetic modeling.
- Ability to analyze S-parameters, radiation patterns, gain, and efficiency.

- Facilitates parameter sweeps and optimization routines.

## HFSS Example: Designing a Microstrip Patch Antenna

This section provides a step-by-step guide to creating a microstrip antenna simulation in HFSS, with practical insights and tips.

### Step 1: Define the Design Specifications

Before starting the simulation, establish the key parameters:

- Operating frequency (e.g., 2.4 GHz for Wi-Fi).
- Substrate material and thickness.
- Patch dimensions.
- Feed point location.

Example specifications:

- Frequency: 2.4 GHz
- Substrate: Rogers 5880, dielectric constant  $\epsilon_r = 2.2$
- Substrate thickness: 1.6 mm
- Patch shape: Rectangular

### Step 2: Calculate Initial Patch Dimensions

Using standard formulas for microstrip patch antennas, approximate the patch length (L) and width

(W):

$\sqrt{\frac{c}{2f \sqrt{\epsilon_r + 1}}}$

$$W = \frac{c}{2f \sqrt{\epsilon_r + 1}}$$

$\sqrt{\epsilon_{eff}}$

$\Delta L$

$$L = \frac{c}{2f \sqrt{\epsilon_{eff}}} - 2\Delta L$$

$\Delta L$

Where:

- $c$  is the speed of light.
- $f$  is the operating frequency.
- $\epsilon_{eff}$  is the effective dielectric constant.
- $\Delta L$  accounts for fringing effects.

Sample calculations:

- $W \approx 45 \text{ mm}$
- $L \approx 38 \text{ mm}$

These are initial estimates; fine-tuning occurs during simulation.

### Step 3: Set Up the HFSS Model

- Create a new project in HFSS.
- Draw the substrate: a rectangle of size slightly larger than the patch (e.g., 60 mm x 60 mm).
- Add the patch: a rectangle with calculated dimensions on top of the substrate.
- Insert the ground plane: a conducting plane underneath the substrate.
- Define the feed: a coaxial probe or microstrip feed line at an optimal position for impedance matching.

Tips:

- Use precise material properties.
- Ensure proper boundary conditions (e.g., radiation boundary for open space).

## Step 4: Assign Materials and Boundaries

- Assign dielectric properties to the substrate.
- Define perfect electric conductor (PEC) for the patch and ground plane.
- Set the port excitation at the feed point (e.g., lumped port or wave port).

## Step 5: Mesh Generation and Simulation Setup

- Generate a mesh fine enough to capture the electromagnetic fields accurately.
- Set the frequency sweep around the target frequency (e.g., 2.2 GHz to 2.6 GHz).
- Define output parameters: S-parameters (S11, S21), radiation patterns, gain.

## Step 6: Run the Simulation and Analyze Results

- Observe the return loss (S11) to assess impedance matching.
- Check the bandwidth where S11 is below -10 dB.
- Review radiation patterns for directivity and beamwidth.
- Calculate gain and efficiency.

Interpreting Results:

- A good design shows a deep S11 dip at the target frequency.
- Radiation pattern should be directional or omnidirectional based on application needs.
- Adjust patch dimensions or feed position iteratively to improve performance.

## Optimizing Microstrip Antenna Design Using HFSS

Optimization enhances antenna performance by systematically varying parameters:

Common Optimization Strategies:

- Adjusting patch dimensions (length and width).
- Changing substrate thickness or dielectric constant.

- Moving the feed point for better impedance matching.
- Introducing slots or parasitic elements for bandwidth enhancement.

HFSS offers built-in parametric sweeps and optimization algorithms to automate this process.

## Practical Tips for Creating Effective HFSS Microstrip Antenna Models

- Always start with theoretical calculations to narrow down design parameters.
- Use symmetry to reduce modeling complexity.
- Ensure proper port placement for accurate excitation.
- Confirm that the mesh is sufficiently refined in critical regions.
- Validate simulation results with analytical calculations or measurements when possible.

## Step-by-Step: Microstrip Antenna HFSS Example

The following sections outline a typical workflow for designing a rectangular microstrip patch antenna in HFSS, including setup, simulation, and analysis.

### 1. Defining Design Specifications

Before opening HFSS, establish the design goals:

- Operating frequency (e.g., 2.4 GHz for Wi-Fi)
- Substrate material and thickness
- Patch dimensions
- Feed type (e.g., coaxial probe, microstrip line)
- Desired radiation pattern and gain

Example specifications:

- Frequency: 2.4 GHz
- Substrate: FR-4 ( $\epsilon_r = 4.4$ )
- Substrate thickness: 1.6 mm
- Patch size: to be calculated based on the dielectric properties
- Feed: Coaxial probe feeding at the center

### 2. Calculating Patch Dimensions

The patch dimensions are critical and depend on the operating frequency and substrate properties.

Rectangular Patch Length (L):

$$[$$

$$L \approx \frac{c}{2f} \sqrt{\epsilon_{\text{eff}}} - 0.02 \times t$$

$$]$$

Patch Width (W):

$$[$$

$$W \approx \frac{c}{2f} \sqrt{\frac{2}{\epsilon_r + 1}}$$

$$]$$

Where:

- $(c)$  = speed of light ( $\sim 3 \times 10^8$  m/s)
- $(f)$  = operating frequency
- $(\epsilon_{\text{eff}})$  = effective dielectric constant
- $(t)$  = substrate thickness

Effective dielectric constant:

$$[$$

$$\epsilon_{\text{eff}} = \frac{\epsilon_r + 1}{2} + \frac{\epsilon_r - 1}{2} \left(1 + 12 \frac{t}{W}\right)^{-0.5}$$

$$]$$

Using these formulas, approximate the patch dimensions, which will be refined during simulation.

### 3. Modeling in HFSS
