- **Resin Matrix:** Binds the fibers together, transferring loads among fibers and protecting them from environmental damage. Typical matrices are thermosetting resins like epoxy, polyester, or vinyl ester, and thermoplastics such as nylon or PEEK.

The combination results in a material that exhibits superior mechanical properties, lightweight characteristics, and tailored functionalities suitable for specific applications.

Types of Fiber Composites

Fiber composites can be classified based on the fiber arrangement and matrix type:

- **Lay-up composites:** Layers of fibers are stacked and impregnated with resin, often used in aerospace and marine industries.

- **Pultruded composites:** Continuous fibers are pulled through a resin bath and then cured, ideal for structural components.
- **Filament-wound composites:** Fibers are wound around a form or mandrel, creating high-strength pipes and tanks.
- **Particulate composites:** Fibers embedded within a matrix to reinforce specific properties, common in sports equipment.
