Understanding Probabilistic Systems and Random Signals

Before diving into the solution manual, it is crucial to understand the core concepts governing probabilistic systems and random signals. These topics form the foundation for analyzing systems subjected to uncertainty and randomness, which are pervasive in real-world applications.

What Are Probabilistic Systems?

Probabilistic systems are systems whose behavior is influenced by inherent randomness. Unlike deterministic models, where a specific input yields a predictable output, probabilistic systems account for uncertainties and probabilistic variations in parameters or inputs. modeled as random processes that evolve over time, such as thermal noise in electronic circuits, speech signals, or stock prices.

Important aspects include:

- Signal characterization by probability density functions (PDFs)
- Power spectral density (PSD)

Example 1: Calculating the Power Spectral Density of a Random Signal

Suppose a stationary random process $\{x(t)\}$ has an autocorrelation function $\{R_x(\tau) = \sigma^2 e^{-\alpha |\tau|}\}$. Determine its power spectral density $\{S_x(f)\}$.

Solution Outline:

- Recall the Wiener-Khinchin theorem: $\{S_x(f) = \mathcal{F}\{R_x(\tau)\}\}$
- Compute the Fourier transform of $\{R_x(\tau)\}$:

[

$$S_x(f) = 2 \sigma^2 \frac{\alpha}{\alpha^2 + (2\pi f)^2}$$

]

- Interpret the result as a Lorentzian function, indicating the frequency distribution of the signal's power.

Key Learning Point: Understanding the relationship between autocorrelation and spectral density through Fourier transforms.

Example 2: Applying Bayesian Updating in Probabilistic Systems

Given prior probability $(P(H) = 0.3)$, and likelihoods $(P(D|H) = 0.8)$, $(P(D|\neg H) = 0.2)$, find the posterior probability $(P(H|D))$.

Solution:

- Use Bayes' theorem:

$$P(H|D) = \frac{P(D|H) P(H)}{P(D|H) P(H) + P(D|\neg H) P(\neg H)}$$

- Calculate denominator:

$$P(D|H) P(H) + P(D|\neg H) P(\neg H) = 0.8 \times 0.3 + 0.2 \times 0.7 = 0.24 + 0.14 = 0.38$$

- Compute posterior:

$$P(H|D) = \frac{0.8 \times 0.3}{0.38} \approx 0.63$$

This example illustrates updating beliefs based on observed data, a critical concept in probabilistic

systems.
