Question 1: What are the main layers of the Earth, and what are their characteristics?

Answer: The Earth's main layers are:

- **Crust:** The outermost layer, solid, and relatively thin. Composed of continental and oceanic crust.
- **Mantle:** Below the crust, semi-solid, extends to about 2,900 km deep. Responsible for convection currents driving plate movements.
- **Outer Core:** Liquid layer composed mainly of iron and nickel, around 2,200 km thick. Generates Earth's magnetic field.

- **Inner Core:** Solid sphere primarily made of iron and nickel, with a radius of about 1,220 km.

Question 2: Explain how earthquakes occur and what causes the different types of seismic waves.

Answer: Earthquakes occur due to the sudden release of energy along faults in the Earth's crust, often caused by tectonic plate movements. The primary causes include stress accumulation at plate boundaries and volcanic activity.

Seismic waves are categorized into:

- **P-waves (Primary Waves):** Compressional waves that travel fastest and arrive first. They can move through solids and liquids.
- **S-waves (Secondary Waves):** Shear waves that move perpendicular to wave direction. They only travel through solids and are slower than P-waves.
- **Surface Waves:** Travel along Earth's surface, causing most of the damage during earthquakes. They include Love and Rayleigh waves.

Question 3: Describe the greenhouse effect and its impact on Earth's climate.

Answer: The greenhouse effect is a natural process where certain gases in Earth's atmosphere (such as carbon dioxide, methane, and water vapor) trap heat from the sun, keeping the planet warm enough to support life. However, human activities like burning fossil fuels have increased these gases, intensifying the greenhouse effect. This leads to global warming, climate change, rising sea levels, and extreme weather patterns.

Applying Knowledge: Sample Questions and Answers

To prepare effectively, review typical exam questions:

- Describe the process of mountain formation at a convergent plate boundary.

Answer: Mountains form at convergent boundaries when two continental plates collide. The immense pressure causes the crust to buckle and fold, creating mountain ranges such as the Himalayas. The collision leads to uplift and folding of rocks, forming high-altitude landforms.

- Explain how weathering contributes to soil formation.

Answer: Weathering breaks down rocks into smaller particles through physical, chemical, and biological processes. Physical weathering fragments rocks mechanically; chemical weathering alters mineral composition; biological weathering involves plant roots and organisms breaking down rocks. These processes produce mineral particles and organic matter, forming soil over time.

- Compare and contrast intrusive and extrusive igneous rocks.

Answer: Intrusive igneous rocks crystallize beneath Earth's surface, resulting in coarse-grained textures due to slow cooling (e.g., granite). Extrusive igneous rocks solidify on Earth's surface, cooling quickly and forming fine-grained textures (e.g., basalt).

- Outline the global effects of climate change.

Answer: Climate change leads to rising global temperatures, melting ice caps, rising sea levels, increased frequency of extreme weather events, and disruptions to ecosystems. These changes threaten biodiversity, agriculture, and human health, necessitating global efforts for mitigation and adaptation.

Final Tips for Exam Success

- Review Diagrams: Be comfortable interpreting geological and geographical diagrams.

Sample Earth Science Semester 2 Exam Questions and Model Answers

Providing sample questions along with well-explained answers can help students prepare effectively. Here are some typical questions and comprehensive answers:

Question 1: Describe the process of seafloor spreading and its significance in plate tectonics.

Answer:

Seafloor spreading is a geological process where new oceanic crust is formed at mid-ocean ridges as magma rises from the mantle. This process occurs at divergent plate boundaries, where tectonic plates move away from each other. As magma reaches the surface, it cools and solidifies, creating new crust that pushes the older crust outward. This continuous process results in the widening of ocean basins and is fundamental to the theory of plate tectonics. It explains the movement of continents, the formation of underwater mountain ranges, and the distribution of earthquakes and volcanoes along mid-ocean ridges.

Question 2: Explain the difference between weather and climate, providing examples.

Answer:

Weather refers to the short-term atmospheric conditions in a specific area, including temperature, humidity, precipitation, wind speed, and cloud cover. For example, a rainy afternoon with temperatures of 20°C is a weather condition. Climate, on the other hand, describes the long-term patterns and averages of weather over a region, typically over 30 years or more. An example of climate is the tropical climate of the Amazon rainforest, characterized by high temperatures and high annual rainfall. While weather can change daily, climate reflects the overall trend and typical conditions of a region.

Question 3: List and describe the three main types of rocks and how they are formed.

Answer:

- Igneous Rocks: Formed through the cooling and solidification of magma or lava. Example: granite (intrusive) and basalt (extrusive).
- Sedimentary Rocks: Created from the accumulation and compaction of mineral and organic particles, often in water bodies. Example: sandstone and shale.
- Metamorphic Rocks: Result from the transformation of existing rocks under high pressure and temperature without melting. Example: marble from limestone and slate from shale.

Question 4: What are the main factors influencing climate change?

Answer:

The primary factors influencing climate change include:

- Greenhouse Gas Emissions: Increased levels of CO₂, methane, and nitrous oxide trap more heat in the atmosphere.
- Deforestation: Reduces carbon absorption, increasing atmospheric CO₂.
- Fossil Fuel Combustion: Burning coal, oil, and gas releases greenhouse gases.
- Industrial Activities: Contribute to pollution and greenhouse gases.
- Natural Factors: Volcanic eruptions and solar variations can also influence climate but are less significant compared to human activities.

Key Topics Covered:

- Weather vs. Climate
- Atmospheric Layers and Composition
- Greenhouse Effect and Global Warming
- Weather Patterns and Fronts

Sample Exam Questions & Answers:

- Q: Explain how the greenhouse effect contributes to maintaining Earth's temperature.

A: Greenhouse gases trap some of the infrared radiation emitted by Earth's surface, preventing heat

from escaping into space and thus warming the planet.

- Q: What are the primary factors influencing weather patterns?

A: Factors include air pressure, temperature, humidity, wind patterns, and the presence of fronts and jet streams.

- Oceanography

Key Topics Covered:

- Ocean Currents and their Impact on Climate
