Common Types of Problems and Their Solutions in the Ninth Edition

Below is a breakdown of typical problem categories and the strategies used to solve them, as exemplified in the solutions manual.

- Finding Derivatives of Marketing Functions

These problems often involve functions such as revenue $R(x) = p(x) x$, where $p(x)$ is price as a function of demand x .

Solution Approach:

- Apply the product rule to differentiate $R(x)$.
- Use the derivative to analyze increasing or decreasing revenue.
- Determine maximum revenue by setting the derivative to zero (critical points).

Example:

Given a demand function $p(x) = 100 - 2x$, find the value of x that maximizes revenue.

Step-by-step:

- Write $R(x) = p(x) x = (100 - 2x) x = 100x - 2x^2$.
- Derive $R'(x) = 100 - 4x$.
- Set $R'(x) = 0 \Rightarrow 100 - 4x = 0 \Rightarrow x = 25$.
- Verify maximum using the second derivative test: $R''(x) = -4$ (negative), confirming a maximum at $x=25$.

- Optimization Problems in Marketing

These involve minimizing costs or maximizing profit within given constraints.

Solution Approach:

- Formulate the objective function based on problem parameters.
- Use differentiation to find critical points.
- Apply constraints to ensure realistic solutions.

Example:

A company's cost function is $C(x) = 50 + 0.5x + 0.01x^2$. Find the production level x that minimizes cost.

Step-by-step:

- Compute $C'(x) = 0.5 + 0.02x$.
- Set $C'(x) = 0 \Rightarrow 0.5 + 0.02x = 0 \Rightarrow x = -25$, which isn't feasible (negative production).
- Since the derivative is always positive for $x \geq 0$, cost increases with production. The minimum cost occurs at the lowest production level, $x=0$.

(Note: In cases where the derivative equals zero at a positive x , that point indicates a minimum or maximum, depending on the second derivative.)

- Analyzing Demand and Supply Curves

These problems involve understanding how changing variables affect market equilibrium.

Solution Approach:

- Set demand equal to supply to find equilibrium.
- Use derivatives to analyze how shifts in demand or supply impact equilibrium price and quantity.

Example:

Demand function: $D(p) = 200 - 4p$; Supply function: $S(p) = 3p + 50$. Find the equilibrium price and quantity.

Step-by-step:

- Set $D(p) = S(p)$: $200 - 4p = 3p + 50$.
- Solve for p : $200 - 50 = 4p + 3p \Rightarrow 150 = 7p \Rightarrow p = 150/7 \approx 21.43$.
- Find quantity: $D(p) = 200 - 4(21.43) \approx 200 - 85.72 \approx 114.28$.
- Equilibrium: Price $\approx \$21.43$, Quantity ≈ 114 units.

Navigating Challenges and Common Pitfalls

While solutions are comprehensive, students often encounter difficulties in:

- Applying the chain rule in complex functions

- Interpreting the economic or marketing significance of derivatives
- Managing multi-step problems under exam conditions

Tips:

- Break down complex derivatives into manageable parts.
- Always relate mathematical results back to the real-world context?what does the derivative tell you about revenue or demand?
- Practice time management and organize work for clarity during exams.

Enhancing Learning with Supplementary Resources

Beyond the solutions manual, consider leveraging:

- Online tutorials: Many platforms provide step-by-step videos explaining similar problems.
- Graphing calculators and software: Tools like Desmos or GeoGebra help visualize functions and their derivatives.
