- Basic Electronics MCQ

Question:

Which of the following devices acts as a voltage regulator?

- a) Zener Diode
- b) Light Emitting Diode (LED)
- c) Photodiode
- d) SCR

Answer:

- a) Zener Diode

Explanation:

A Zener diode is specifically designed to operate in the breakdown region, maintaining a nearly constant voltage across its terminals over a range of current variations. This property makes it ideal as a voltage regulator in electronic circuits. When used in reverse bias, the Zener diode clamps the voltage, providing a stable reference. LEDs emit light when forward biased, photodiodes are sensitive to light, and SCRs are used as switches but do not regulate voltage.

- a) Inductive transducer
- b) Capacitive transducer
- c) Piezoelectric transducer
- d) All of the above

Answer:

- d) All of the above

Explanation:

All these transducers directly convert physical parameters into electrical signals, but their working principles differ:

- Inductive transducers (e.g., LVDT) use changes in inductance due to physical displacement.
- Capacitive transducers vary capacitance with physical changes, such as distance or pressure.
- Piezoelectric transducers generate voltage directly when subjected to mechanical stress.

Hence, all listed options are correct.

- Circuit Theory MCQ

Question:

In a series R-L circuit, the impedance is given by:

- a) $Z = R + j\omega L$
- b) $Z = R - j\omega L$
- c) $Z = \sqrt{R^2 + (\omega L)^2}$
- d) Both a and c

Answer:

- d) Both a and c

Explanation:

Impedance (Z) in a series RL circuit is a complex quantity:

- Complex form: $Z = R + j\omega L$, where j is the imaginary unit and ω is angular frequency.
- Magnitude: $|Z| = \sqrt{R^2 + (\omega L)^2}$.

Both forms are correct descriptions: the first as a complex impedance, the second as its magnitude.

- Digital Electronics MCQ

Question:

- a) AND gate
- b) OR gate
- c) NOT gate
- d) NAND gate

Answer:

a) AND gate

Explanation:

An AND gate produces a high output only when all its inputs are high (true). If any input is low, the output is low. OR gates output high if any input is high, NOT gates invert the input, and NAND gates output low only when all inputs are high.

- Signal Processing MCQ

Question:

In an active low-pass filter, the cutoff frequency is determined by which component?

a) Resistor and capacitor

b) Inductor and capacitor

c) Resistor and inductor

d) Diode and resistor

Answer:

a) Resistor and capacitor

Explanation:

A typical active low-pass filter uses an operational amplifier with a resistor and capacitor to set the cutoff frequency. The cutoff frequency (f_c) is given by:

$$f_c = \frac{1}{2\pi RC}$$

where (R) is the resistance and (C) is the capacitance. Inductors are not commonly used in typical active low-pass filters, and diodes are unrelated to the cutoff frequency setting.

Sample BJT Multiple Choice Questions with Answers

Here, we explore typical MCQs, their correct answers, and explanations to deepen understanding.

- Basic Operation of BJT

Question: Which of the following best describes the function of a Bipolar Junction Transistor?

- A) It acts as a resistor with variable resistance.
- B) It functions as a current-controlled switch or amplifier.
- C) It converts AC signals into DC signals.
- D) It stores electrical charge like a capacitor.

Answer: B) It functions as a current-controlled switch or amplifier.

Explanation: BJTs operate primarily as current-controlled devices, where a small input current at the base controls a larger current flow from collector to emitter. This property makes them useful as amplifiers and switches.

- BJT Configurations

Question: In which configuration is the BJT most commonly used for voltage amplification?

- A) Common collector
- B) Common base
- C) Common emitter
- D) Common drain

Answer: C) Common emitter

Explanation: The common emitter configuration is most popular for voltage amplification due to its high voltage gain and moderate input/output impedance.

- Biasing and Operating Regions

Question: If a BJT's base-emitter junction is forward biased, and the collector-base junction is reverse biased, the transistor is in:

- A) Cut-off
- B) Active region
- C) Saturation
- D) Break-down

Answer: B) Active region

Explanation: Forward biasing the base-emitter junction and reverse biasing the collector-base junction places the BJT in its active region, suitable for amplification.

- Parameters of BJT

Question: If the collector current (I_C) is 10 mA and the current gain (β) is 100, what is the base current (I_B)?

- A) 0.1 mA
- B) 1 mA
- C) 10 mA
- D) 100 mA

Answer: B) 0.1 mA

Explanation: Using the relation $I_C = \beta I_B$, $I_B = I_C / \beta = 10 \text{ mA} / 100 = 0.1 \text{ mA}$.

- Power Dissipation in BJT

Question: Which of the following factors does NOT directly influence the power dissipation in a BJT?

- A) Collector-emitter voltage (V_{CE})

B) Collector current (I_C)

C) Base current (I_B)

D) Ambient temperature

Answer: D) Ambient temperature

Explanation: Power dissipation is primarily determined by V_{CE} and I_C ($P = V_{CE} I_C$). While ambient temperature affects device operation and thermal management, it does not directly influence power dissipation calculations.

Advanced MCQs: Testing Deep Understanding

- Early Effect

Question: The phenomenon where the collector current increases with collector-base voltage even when the base-emitter voltage remains constant is known as:

A) Avalanche breakdown

B) Early effect

C) Punch-through

D) Hysteresis

Answer: B) Early effect

Explanation: The Early effect causes variation in the collector current due to base-width modulation as collector-base voltage changes, affecting transistor characteristics.

- Switching Behavior

Question: For a BJT used as a switch, which of the following states corresponds to saturation?

A) Transistor is fully OFF

B) Transistor is in cutoff region

C) Transistor is fully ON

D) Transistor is in active region

Answer: C) Transistor is fully ON

Explanation: Saturation indicates the transistor conducts maximum current with minimal voltage across collector-emitter, acting as a closed switch.

- Load Line Analysis

Question: The load line on the output characteristic graph of a BJT represents:

A) The maximum collector current

B) The relationship between collector voltage and current for a given load and supply voltage

C) The biasing point of the transistor

D) The frequency response of the transistor

Answer: B) The relationship between collector voltage and current for a given load and supply voltage

Explanation: The load line is a graphical representation showing all possible collector voltage and current combinations for a specific load and supply voltage, helping determine the operating point.

QuestionAnswer What does BJT stand for in electronics? BJT stands for Bipolar Junction Transistor. Which of the following is a common configuration of BJT? Common emitter, common base, and common collector are the three basic BJT configurations. In a BJT, what is the primary purpose of the base terminal? The base acts as the control terminal that modulates the current flow between the collector and emitter. Which of the following is true about the operation of an NPN BJT? In an NPN transistor, a positive voltage applied to the base relative to the emitter allows current to flow from collector to emitter. What is the typical current flow direction in a BJT during forward-active operation? The majority charge carriers flow from the emitter to the collector, with the base controlling this current. Which of the following is a characteristic of a BJT in saturation? In saturation, both the base-emitter and base-collector junctions are forward biased, allowing maximum current flow.
