Detailed Breakdown of Key Topics

Time Value of Money (TVM)

Why It Matters:

The core idea behind TVM is that a dollar today is worth more than a dollar tomorrow because of its potential to earn interest. This concept is fundamental for valuing investments, calculating loan payments, and assessing financial decisions.

Key Calculations:

- Present Value (PV): The current worth of a future sum.
- Future Value (FV): The amount an investment will grow to over time.
- Discount Rate: The rate used to determine PV from FV.
- Annuities and Perpetuities: Series of cash flows occurring at regular intervals.

Practical Applications:

- Comparing investment options with different cash flow streams.
- Calculating mortgage or loan payments.
- Valuing bonds and stocks.

Risk and Return

Understanding the Relationship:

Investments with higher potential returns typically carry higher risk. The challenge is to balance these to meet financial goals.

Measuring Risk:

- Standard deviation of returns
- Beta coefficient (for stocks)
- Variance

Expected Return Calculations:

Expected return is the weighted average of possible outcomes, considering their probabilities.

Portfolio Diversification:

Reducing risk by combining different assets whose returns are not perfectly correlated.

Financial Markets and Institutions

Market Types:

- Primary Markets: Where new securities are issued.
- Secondary Markets: Where existing securities are traded.

Key Players:

- Investors (retail and institutional)
- Firms issuing securities
- Financial intermediaries (banks, brokerages)

Market Efficiency:

The Efficient Market Hypothesis (EMH) suggests that stock prices reflect all available information, impacting investment strategies.

Security Valuation Techniques

Discounted Cash Flow (DCF):

Calculates the present value of expected future cash flows, providing a basis for determining whether an asset is over- or undervalued.

Valuation Models:

- Dividend Discount Model (DDM)
- Free Cash Flow to Firm (FCFF)
- Relative valuation (comparing multiples)

Capital Budgeting and Investment Decisions

NPV Method:

Calculates the difference between the present value of cash inflows and outflows. A positive NPV indicates a profitable project.

IRR Method:

The discount rate that makes the NPV zero; used to assess profitability.

Other Techniques:

- Payback period
- Profitability index

Cost of Capital

Components:

- Cost of debt: After-tax interest rate
- Cost of equity: Expected return required by shareholders

WACC (Weighted Average Cost of Capital):

A weighted average of the costs of debt and equity, used as a hurdle rate for investment decisions.
