- Tools: Magnifying glasses, borescopes, and proper lighting.
- Procedure: Systematic examination of accessible surfaces, focusing on high-stress areas like wing roots and fuselage joints.

Ultrasonic Testing (UT)

- Purpose: Detects internal flaws such as cracks, voids, or corrosion beneath the surface.
- Method: High-frequency sound waves are transmitted into the material; reflections indicate anomalies.
- Application: Used extensively on fuselage frames, wing spars, and landing gear components.

Radiographic Testing (RT)

- Purpose: Provides a detailed internal image of components.
- Method: X-rays or gamma rays pass through the material; film or digital detectors capture the image.

- Application: Critical for inspecting welds, structural joints, and thick components.

Magnetic Particle Inspection (MPI)

- Purpose: Detects surface and near-surface discontinuities in ferromagnetic materials.
- Method: Magnetizing the component and applying magnetic particles that accumulate at flaw sites.
- Application: Used on landing gear components and steel structural elements.

Liquid Penetrant Testing (PT)

- Purpose: Identifies surface-breaking cracks.
- Method: Applying a dye penetrant, removing excess, then applying a developer to reveal flaws.
- Application: Suitable for inspecting fuselage panels and wing surfaces.

Eddy Current Testing (ET)

- Purpose: Detects surface and subsurface flaws, especially in conductive materials.
- Method: Electromagnetic induction generates currents that reveal anomalies.
- Application: Often used for fast, localized inspections of critical components.

Implementation and Best Practices in NDT Procedures

The manual emphasizes strict adherence to standardized procedures to ensure accuracy and repeatability:
