Sample MCQs in Surgery Schwartz with Answers

Below are representative MCQs with detailed explanations to illustrate common question formats and concepts.

1. General Surgery Principles

Question:

A 45-year-old man presents with a sudden onset of severe epigastric pain radiating to the back. Laboratory tests reveal elevated serum amylase. Which of the following is the most likely diagnosis?

- a) Gastric ulcer
- b) Acute pancreatitis
- c) Peptic stricture
- d) Cholelithiasis

Answer:

- b) Acute pancreatitis

Explanation:

The presentation of sudden severe epigastric pain radiating to the back, along with elevated serum amylase, is characteristic of acute pancreatitis. Other options are less likely: gastric ulcers typically cause localized epigastric pain without radiating or elevated amylase, peptic strictures are chronic, and cholelithiasis may cause biliary colic but not pancreatitis unless complicated.

2. Trauma Surgery

Question:

A 30-year-old male involved in a motor vehicle accident presents with hypotension and tachycardia. On abdominal examination, there is tenderness and guarding. FAST exam is positive. What is the most appropriate next step?

- a) Observation and serial exams
- b) Immediate laparotomy
- c) Antibiotic therapy
- d) CT scan of the abdomen

Answer:

- b) Immediate laparotomy

Explanation:

Signs of hypovolemic shock, positive FAST indicating intra-abdominal bleeding, and abdominal tenderness warrant prompt surgical intervention. Delaying could worsen hemorrhage. While CT scans are useful in stable patients, shock and positive FAST require urgent surgery.

3. Gastrointestinal Surgery

Question:

A 65-year-old woman with a history of colon cancer presents with jaundice and pruritus. Laboratory tests show elevated bilirubin and alkaline phosphatase. Imaging reveals a mass at the head of the pancreas. What is the most probable diagnosis?

- a) Gallstone-induced cholestasis
- b) Pancreatic head carcinoma causing biliary obstruction
- c) Liver metastasis
- d) Primary sclerosing cholangitis

Answer:

- b) Pancreatic head carcinoma causing biliary obstruction

Explanation:

Jaundice and pruritus with a mass at the pancreatic head suggest obstructive jaundice secondary to pancreatic carcinoma. This is common in elderly patients with such presentation.

4. Hepatobiliary Surgery

Question:

Which of the following is the most sensitive diagnostic modality for detecting choledocholithiasis?

- a) Ultrasound
- b) MRCP (Magnetic Resonance Cholangiopancreatography)
- c) ERCP (Endoscopic Retrograde Cholangiopancreatography)
- d) CT scan

Answer:

- b) MRCP

Explanation:

MRCP is highly sensitive and non-invasive for detecting bile duct stones. ERCP is both diagnostic and therapeutic but is more invasive. Ultrasound has limitations in visualizing stones within the common bile duct, especially if small.

5. Vascular Surgery

Question:

A 70-year-old man with a history of smoking presents with a pulsatile abdominal mass. Ultrasound confirms an infrarenal abdominal aortic aneurysm (AAA) measuring 5.5 cm. What is the recommended management?

- a) Observation with serial imaging
- b) Elective surgical repair
- c) Antibiotic therapy
- d) Endovascular stent placement only in symptomatic cases

Answer:

- b) Elective surgical repair

Explanation:

AAAs ≥ 5.5 cm in diameter warrant elective surgical repair due to high risk of rupture. Observation is appropriate for smaller aneurysms. Endovascular repair is an option, but the question emphasizes standard management.
