- Capable of handling nested structures like parentheses.

Turing Machines (TM)

Turing machines are the most powerful and versatile model, capable of simulating any algorithm.

- Includes an infinite tape, read/write head, and a set of rules.
- Fundamental in defining decidability and computability.

Note: Turing machines serve as a standard for the theoretical limits of computation.

Languages and Grammars

Formal languages and grammars are central to understanding what machines can recognize and generate.

Types of Formal Languages

Based on their complexity, languages are classified into:

- Regular Languages
- Context-Free Languages
- Context-Sensitive Languages

Grammars and Production Rules

Grammars define the syntax of languages:

- **Regular Grammar**: Rules with a single non-terminal and terminal.
- **Context-Free Grammar (CFG)**: Productions with a single non-terminal on the left.

Application: Programming language syntax, compiler design.

Decidability and Computability

A significant aspect of the theory involves understanding problems that can or cannot be solved

algorithmically.

Problems for which an algorithm exists that provides a yes/no answer within finite steps.

- Examples: Determining if a string belongs to a regular language, or if a context-free grammar generates a particular string.

Undecidable Problems

Problems with no algorithmic solution that can definitively answer the question in all cases.

- Halting problem: Determining whether a program halts or runs forever.
- Post Correspondence Problem.

Reducibility and Rice?s Theorem

- Reducibility: Showing that one problem can be transformed into another, indicating relative undecidability.
