Matlab code for sensor networks has become an essential tool for researchers and engineers working in the field of wireless sensor networks (WSNs). MATLAB's powerful computational capabilities, combined with its extensive library of toolboxes and ease of visualization, make it an ideal platform for simulating, analyzing, and designing sensor network systems. Whether you're developing algorithms for data aggregation, routing, localization, or energy management, MATLAB code provides a flexible and efficient environment to prototype and test your ideas before deploying them in real-world applications.

In this article, we will explore various aspects of MATLAB code for sensor networks, including basic simulation techniques, network topology modeling, data collection algorithms, energy efficiency strategies, and visualization tools. By the end of this guide, you'll have a comprehensive understanding of how to implement and optimize sensor network algorithms using MATLAB.

Understanding Sensor Network Modeling in MATLAB

1. Setting Up Sensor Nodes

The first step in simulating sensor networks in MATLAB involves defining sensor nodes, including their positions, communication ranges, and other relevant attributes. Typically, nodes are represented as points in a 2D or 3D space.

```
``matlab

numNodes = 100; % Number of sensor nodes

areaSize = 100; % Size of the deployment area

% Randomly deploy nodes within the area

nodesX = rand(1, numNodes) areaSize;

nodesY = rand(1, numNodes) areaSize;

nodesPos = [nodesX; nodesY];

````
```

This code initializes 100 nodes randomly distributed within a 100x100 area.

## 2. Defining Network Topology

Once nodes are positioned, the next step is to define the network topology?how nodes are connected based on their proximity.

```
```matlab

communicationRange = 20; % Communication radius

% Calculate pairwise distances

distances = squareform(pdist(nodesPos'));

% Create adjacency matrix

adjMatrix = distances <= communicationRange;

```
```

This creates an adjacency matrix where entries are 1 if two nodes are within communication range.

## Implementing Data Routing Algorithms

### 1. Simple Flooding Protocol

Flooding is a basic routing method where each node broadcasts data to its neighbors.

```
```matlab

function routes = floodingRouting(adjMatrix, source, destination)

numNodes = size(adjMatrix,1);

visited = false(1,numNodes);

queue = source;

routes = cell(1, numNodes);
```

```
routes{source} = source;

visited(source) = true;

while ~isempty(queue)

current = queue(1);

queue(1) = [];

neighbors = find(adjMatrix(current,:));

for neighbor = neighbors

if ~visited(neighbor)

visited(neighbor) = true;

routes{neighbor} = [routes{current}, neighbor];

queue(end+1) = neighbor;

end

end

end

disp(['Route from node ', num2str(source), ' to node ', num2str(destination), ':']);

disp(routes{destination});

end

...
```

This function performs flooding from a source node to a destination, recording the route.

2. Energy-Efficient Routing

To prolong network lifetime, energy-aware routing algorithms, such as LEACH or PEGASIS, can be

simulated with MATLAB code by incorporating energy consumption models.

```
```matlab
```

```
% Example: simple energy consumption model
```

```
initialEnergy = 100; % Joules
```

```
energyPerTransmission = 0.5; % Joules
```

```
nodeEnergies = initialEnergy ones(1, numNodes);
```

```
% During routing
```

```
for node = routeNodes
```

```
nodeEnergies(node) = nodeEnergies(node) - energyPerTransmission;
```

```
end
```

```
```
```

This code subtracts energy per transmission from nodes involved in routing.

Sensor Network Data Processing and Analysis

1. Data Aggregation Techniques

Data aggregation reduces redundancy and conserves energy. MATLAB offers various functions to implement aggregation algorithms like in-network processing.

```
```matlab
```

```
% Simulated sensor readings
```

```
sensorData = rand(1, numNodes) 50; % Example sensor readings
```

```
% Simple averaging at cluster heads
```

```
clusterHeads = randperm(numNodes, 10);
```

```
for ch = clusterHeads

members = find(clusterMembership == ch);

aggregatedData(ch) = mean(sensorData(members));

end

'''
```

This code demonstrates basic data aggregation at cluster heads.

## 2. Anomaly Detection

Detecting anomalies in sensor data is vital for identifying faults or unusual events.

```
```matlab

meanData = mean(sensorData);

stdData = std(sensorData);

threshold = 3 stdData;

anomalies = find(abs(sensorData - meanData) > threshold);

disp('Anomalous sensor readings at nodes:');

disp(anomalies);

'''
```

Using statistical methods, MATLAB helps identify suspicious data points.

Energy Management Strategies in MATLAB

1. Sleep Scheduling

Implementing sleep schedules helps conserve energy by turning off sensors periodically.

```
```matlab
```

```
sleepCycle = 10; % Time units

nodeStates = ones(1, numNodes); % 1 = active, 0 = sleep

for t = 1:100

 activeNodes = mod(t, sleepCycle) ~= 0;

 nodeStates(~activeNodes) = 0;

 % Use nodeStates in simulation to model energy consumption

end

...

```

This simple cycle turns off nodes periodically.

## 2. Energy-Aware Clustering

Forming clusters based on residual energy ensures balanced energy consumption.

```
```matlab

% Initialize residual energy

residualEnergy = nodeEnergies;

% Cluster formation based on energy

[~, clusterCenters] = sort(residualEnergy, 'descend');

clusters = cell(1, numClusters);

for i = 1:numClusters

    clusters{i} = find(residualEnergy >= residualEnergy(clusterCenters(i)));

end

...

```

This approach ensures nodes with higher residual energy serve as cluster heads.

Visualization of Sensor Networks in MATLAB

1. Plotting Nodes and Links

Visualizing network topology helps in understanding connectivity and coverage.

```
```matlab

figure;

scatter(nodesX, nodesY, 'filled');

hold on;

for i = 1:numNodes

 neighbors = find(adjMatrix(i,:));

 for neighbor = neighbors

 plot([nodesX(i), nodesX(neighbor)], [nodesY(i), nodesY(neighbor)], 'k-');

 end

end

title('Sensor Network Topology');

xlabel('X Position');

ylabel('Y Position');

hold off;

```
```

2. Visualizing Data Flow

Showcasing routing paths and data dissemination.

```
```matlab

% Suppose route is known

routeNodes = [1, 5, 10, 50];

plot(nodesX(routeNodes), nodesY(routeNodes), '-o', 'LineWidth', 2);

for i = 1:length(routeNodes)-1

 plot([nodesX(routeNodes(i)), nodesX(routeNodes(i+1))], [nodesY(routeNodes(i)),
 nodesY(routeNodes(i+1))], 'r-');

end

title('Data Routing Path');

```
```

This visualization emphasizes the data flow path in the network.
