Problem: Write a Java program to find the largest element in an array.

Solution Approach:

- Understand the Problem: Need to scan through an array and determine the maximum value.
- Breakdown: Initialize a variable with the first element, iterate through remaining elements, and update the variable when a larger element is found.
- Algorithm:
 - Set max = first element
 - For each element in the array:
 - If element > max, update max

- Output max

- Code Implementation:

```
```java

public class LargestElement {

public static void main(String[] args) {

int[] nums = {23, 45, 67, 89, 12, 34};

int max = nums[0];

for (int i = 1; i
if (nums[i] > max) {

max = nums[i];

}

}

System.out.println("Largest element is: " + max);

}

}

```
```

This example showcases how problem analysis, algorithm design, and coding come together, demonstrating the core philosophy of Balagurusamy's approach.
