- B) Case-control study
- C) Cohort study
- D) Ecological study

Correct Answer: C) Cohort study

Short-Answer Example:

Define 'confounding' in epidemiology and describe one method to control for confounding in analytical studies.

Sample Response:

Confounding occurs when an extraneous variable is associated with both the exposure and the outcome, potentially distorting the true association. One method to control for confounding is stratification, where data are analyzed within strata of the confounder to assess the exposure-outcome relationship independently of that variable.

Data Interpretation Exercise:

Given a 2x2 table of exposure and disease status, calculate the odds ratio and interpret its meaning.

	Disease Present	Disease Absent	Total
--	-----------------	----------------	-------

	-----	-----	-----
--	-------	-------	-------

Exposed	50	150	200
---------	----	-----	-----

Unexposed	30	170	200
-----------	----	-----	-----

Answer:

Odds of disease in exposed = $50/150 = 0.333$

Odds in unexposed = $30/170 \approx 0.176$

Odds Ratio (OR) = $0.333 / 0.176 \approx 1.89$

Interpretation:

Individuals exposed have approximately 1.89 times higher odds of disease compared to unexposed individuals, suggesting a potential association.
