5. Using the Power of a Point Theorem

This theorem relates the lengths of segments created by chords, secants, and tangents intersecting outside or inside a circle.

Sample Questions and Step-by-Step Solutions

Question 1: Find the measure of an inscribed angle

Given a circle with an inscribed angle measuring 40° , find the measure of its intercepted arc.

Solution:

- Recall that the measure of an inscribed angle is half the measure of its intercepted arc.
- Set up the equation: **angle measure** = $\frac{1}{2} \times$ **arc measure**.
- Substitute the given value: $40^\circ = \frac{1}{2} \times$ arc measure.
- Multiply both sides by 2: arc measure = 80° .
- Answer: The intercepted arc measures 80° .

Question 2: Find the length of a chord given its distance from the center

A circle has a radius of 10 units, and a chord is 6 units away from the center. Find the length of the

chord.

Solution:

- Draw the radius from the center to the midpoint of the chord, forming a right triangle with half the chord length and the distance from the center.
- Use the Pythagorean theorem: **half chord length** = $\sqrt{(\text{radius}^2 - \text{distance}^2)} = \sqrt{(10^2 - 6^2)} = \sqrt{(100 - 36)} = \sqrt{64} = 8$.
- The full chord length is twice the half: $2 \times 8 = 16$ units.
- Answer: The chord length is 16 units.

Question 3: Applying the Power of a Point theorem

Two secants intersect outside a circle, with segments measuring 3 units and 7 units on one secant and 4 units and x units on the other. Find x .

Solution:

- Recall the Power of a Point formula: **external segment $\times$ entire secant** are equal for both secants.
- Set up the equation: $3 \times 10 = 4 \times (x + 4)$.
- Solve for x : $30 = 4(x + 4) \Rightarrow 30 = 4x + 16$.
- Subtract 16 from both sides: $14 = 4x$.
- Divide both sides by 4: $x = 3.5$.
- Answer: x equals 3.5 units.

Sample Problems from Chapter 10 and Their Solutions

Problem 1: Inscribed Angles

Question: In a circle, an inscribed angle intercepts an arc measuring 120° . What is the measure of the inscribed angle?

Solution:

The measure of an inscribed angle is half the measure of its intercepted arc.

Therefore,

$$\text{Angle measure} = 120^\circ / 2 = 60^\circ.$$

Answer: The inscribed angle measures 60° .

Problem 2: Arc Length Calculation

Question: A circle has a radius of 10 units. Find the length of an arc that intercepts a 90° central angle.

Solution:

$$\text{Arc length} = (\text{central angle} / 360^\circ) \times 2\pi r$$

$$= (90^\circ / 360^\circ) \times 2\pi \times 10$$

$$= (1/4) \times 20\pi$$

$$= 5\pi \approx 15.7 \text{ units.}$$

Answer: The arc length is approximately 15.7 units.

Problem 3: Tangent and Secant Properties

Question: A tangent and a secant intersect outside a circle, forming an angle of 40° . If the secant's external segment measures 6 units, what is the length of the tangent segment?

Solution:

Using the tangent-secant theorem,

$$(\text{External segment of secant}) \times (\text{whole secant segment}) = (\text{tangent segment})^2.$$

Suppose the secant's external segment is 6, and the entire secant segment is x , then:

$$6 \times x = (\text{tangent})^2.$$

To find the tangent segment, additional information about the secant's total length is needed. If, for example, the entire secant length is 10, then:

$$6 \times 10 = (\text{tangent})^2 \Rightarrow 60 = (\text{tangent})^2 \Rightarrow \text{tangent} = \sqrt{60} \approx 7.75 \text{ units.}$$

Answer: The tangent segment measures approximately 7.75 units.
