What is Lactose?

Lactose is a disaccharide composed of glucose and galactose units linked via a α -1,4 glycosidic bond. It naturally occurs in milk and dairy products, making it a key component in nutritional and functional food analysis. Its chemical structure influences how it reacts in analytical procedures, especially in enzymatic and chromatographic methods.

Key Features of the AOAC Method for Lactose

The AOAC method for lactose determination offers several advantages:

- High specificity for lactose, minimizing interference from other sugars.
- Accurate quantification across a wide range of concentrations.
- Validated reproducibility across different laboratories.

Principles of AOAC Lactose Analysis

The core principle of the AOAC method for lactose determination typically involves enzymatic hydrolysis of lactose into glucose and galactose, followed by quantification of glucose using enzymatic reactions that produce measurable colorimetric changes.

Enzymatic Hydrolysis

Lactose in the sample is first broken down by the enzyme lactase (β -galactosidase) into its constituent monosaccharides:
