Sample Questions from the June 2013 Paper and Model Answers

To illustrate typical questions, here are some examples with brief explanations:

Question 1: Atomic Structure

Describe how the atomic model has developed over time.

Model Answer:

Initially, atoms were thought to be solid spheres (Dalton's model). Later, J.J. Thomson proposed the plum pudding model with electrons embedded in a positive sphere. Rutherford's gold foil experiment revealed a small, dense nucleus, leading to the nuclear model. Bohr then introduced electron shells, explaining atomic spectra. Modern models incorporate quantum mechanics, describing electrons as wave-like entities.

Question 2: Calculations

Calculate the number of moles in 12 grams of carbon.

Model Answer:

Number of moles = mass / relative atomic mass

$$= 12 \text{ g} / 12 \text{ g/mol} = 1 \text{ mol}$$

Question 3: Bonding and Properties

Explain why diamonds are so hard compared to graphite.

Model Answer:

Diamonds have a giant covalent structure with carbon atoms bonded in a 3D network, making the layers rigid and strong. In contrast, graphite has layers of carbon atoms held together by weak van der Waals forces, allowing layers to slide past each other, making graphite soft and slippery.
