3. Degrees of Freedom (DOF)

Each node in the finite element mesh has associated degrees of freedom, representing the independent displacements or rotations. The number of DOF per node varies based on element type and problem dimension.

4. Element Stiffness Matrix

Fundamental to FEA, the stiffness matrix relates nodal displacements to applied forces within an element. It encapsulates the material properties and geometry of the element.

5. Assembly of Global Stiffness Matrix

Individual element stiffness matrices are assembled into a global matrix representing the entire structure. Proper assembly accounts for shared nodes and boundary conditions.

6. Application of Boundary Conditions

Constraints such as fixed supports or prescribed displacements are incorporated to simulate real-world constraints, ensuring accurate solutions.

7. Solving the System of Equations

The assembled system yields a set of equations, typically expressed as:

[

$$\mathbf{K} \mathbf{u} = \mathbf{f}$$

]

where $\mathbf{K}$ is the global stiffness matrix, $\mathbf{u}$ is the vector of unknown displacements, and $\mathbf{f}$ is the force vector.

Mathematical Foundations of FEA

FEA relies heavily on mathematical principles, including linear algebra, calculus, and differential equations.
