Fundamentals of Process Heat Transfer

Types of Heat Transfer Mechanisms

Heat transfer occurs through three primary mechanisms:

- Conduction: Transfer of heat through a solid material or stationary fluid due to temperature gradients.
- Convection: Heat transfer between a solid surface and a moving fluid (liquid or gas).
- Radiation: Transfer of heat through electromagnetic waves, independent of a medium.

Understanding these mechanisms is essential before applying Serth's manual methods, as different problems require different approaches.

Key Concepts in Heat Transfer

- Heat flux: The rate of heat transfer per unit area (W/m^2).
- Thermal conductivity (k): A material property indicating how well it conducts heat.

- Convective heat transfer coefficient (h): Represents the efficiency of heat transfer between a surface and fluid.
- Temperature gradients: Differences in temperature driving heat transfer.
- Steady-state vs. transient: Steady-state implies constant temperatures over time; transient involves changes with time.
