Vector Algebra and Operations

Vector algebra forms the backbone of vector analysis. The operations and properties are fundamental to manipulating and understanding vector fields.

- **Vector Addition:** Geometrically, adding vectors involves placing the tail of one vector at the head of another, resulting in the resultant vector. Algebraically, it involves summing respective components

- **Scalar (Dot) Product:** Given vectors $\mathbf{A}$ and $\mathbf{B}$, their dot product is $\mathbf{A} \cdot \mathbf{B} = |\mathbf{A}||\mathbf{B}|\cos\theta$. It yields a scalar and is used to find angles and projections.

- **Vector (Cross) Product:** $\mathbf{A} \times \mathbf{B}$ produces a vector perpendicular to both $\mathbf{A}$ and $\mathbf{B}$. Magnitude equals $|\mathbf{A}||\mathbf{B}|\sin\theta$, and direction follows the right-hand rule.

Differentiation of Vector Functions

This section deals with how vectors change with respect to a parameter, typically time or position.

- **Velocity Vector:** $\mathbf{v} = \frac{d\mathbf{r}}{dt}$, representing the rate of change of position

- **Acceleration Vector:** $\mathbf{a} = \frac{d\mathbf{v}}{dt}$, indicating how velocity changes over time

- **Chain Rule Application:** Used when vectors depend on multiple variables or parameters

Line, Surface, and Volume Integrals

These integrals generalize the concept of summing quantities over geometrical entities.
