1. Developing Plugins

Plugins are server-side components that run in response to specific events, such as create, update, or delete operations on records.

Steps to develop a plugin:

- Create a new Class Library project in Visual Studio.
- Reference the necessary assemblies (`Microsoft.Xrm.Sdk.dll`, `Microsoft.Crm.Sdk.Proxy.dll`).
- Implement the `IPlugin` interface.
- Register the plugin using the Plugin Registration Tool or through the SDK.

Sample plugin outline:

```
``csharp

public class SamplePlugin : IPlugin

{

public void Execute(IServiceProvider serviceProvider)

{
```

```
// Obtain the execution context
```

```
IPluginExecutionContext context =  
(IPluginExecutionContext)serviceProvider.GetService(typeof(IPluginExecutionContext));
```

```
// Obtain the organization service
```

```
IOrganizationServiceFactory factory =  
(IOrganizationServiceFactory)serviceProvider.GetService(typeof(IOrganizationServiceFactory));
```

```
IOrganizationService service = factory.CreateOrganizationService(context.UserId);
```

```
// Your logic here
```

```
}
```

```
}
```

```
...
```

Common use cases:

- Data validation
- Automated record updates
- Integration triggers

2. Creating Custom Workflows

Workflows automate business processes and can be configured using the Dynamics CRM workflow designer. For advanced customization, custom workflow activities can be developed.

Developing custom workflow activities:

- Create a class library project.
- Reference the SDK assemblies.
- Derive from `CodeActivity``.
- Implement the `Execute`` method.

Sample custom workflow activity:

```
```csharp

public class SampleWorkflowActivity : CodeActivity

{

protected override void Execute(CodeActivityContext context)

{

// Workflow logic

}

}

```
```
