Solution:

- Initial concentration $(C_1 = 0.5 \text{ M})$
- Initial volume $(V_1 =)$ unknown; assume 100 mL for calculation
- Final volume $(V_2 = 250 \text{ mL} = 0.25 \text{ L})$
- Using $(C_1 V_1 = C_2 V_2)$:

$[$

$$C_2 = \frac{C_1 V_1}{V_2}$$

$]$

Substituting:

$[$

$$C_2 = \frac{0.5 \times 0.1}{0.25} = 0.2 \text{ M}$$

$]$

Answer: The molarity of the diluted solution is 0.2 M.

Problem 3: Calculating Molality from Molarity and Density

Question: A solution has a molarity of 1 M, and its density is 1.2 g/mL. Calculate the molality of the solution.

Solution:

- Assume 1 liter of solution:
- Mass of solution = $(1.2 \text{ g/mL} \times 1000 \text{ mL}) = 1200 \text{ g}$
- Moles of solute = 1 mol
- Molar mass of solute (e.g., NaCl) = 58.5 g/mol
- Mass of solute = 58.5 g
- Mass of solvent = Total mass - solute mass = $1200 \text{ g} - 58.5 \text{ g} = 1141.5 \text{ g} = 1.1415 \text{ kg}$
- Molality $(m = \frac{1 \text{ mol}}{1.1415 \text{ kg}} \approx 0.876 \text{ mol/kg})$

Illustrative Numerical Problems and Solutions

Problem 1: Molarity Calculation

Question: How many grams of sodium chloride (NaCl) are required to prepare 2 liters of a 0.5 M solution?

Solution:

- Moles needed = Molarity $\times$ Volume = $0.5 \text{ mol/L} \times 2 \text{ L} = 1 \text{ mol}$
- Molar mass of NaCl = 58.44 g/mol
- Grams required = $1 \text{ mol} \times 58.44 \text{ g/mol} = 58.44 \text{ grams}$

Key Point: Always verify units and ensure volume is in liters.

Problem 2: Freezing Point Depression

Question: Calculate the freezing point depression of a 0.1 molal solution of potassium chloride (KCl) in water. (K_f for water = $1.86^\circ\text{C kg/mol}$)

Solution:

- $\Delta T_f = K_f \times m \times i$
- $K_f = 1.86^\circ\text{C kg/mol}$
- $m = 0.1 \text{ mol/kg}$
- $i = 2$ (since KCl dissociates into K^+ and Cl^-)

$$\Delta T_f = 1.86 \times 0.1 \times 2 = 0.372^\circ\text{C}$$

Result: The solution lowers the freezing point by 0.372°C .

Insight: Always consider the dissociation factor i for ionic compounds.

Problem 3: Colligative Property - Boiling Point Elevation

Question: A solution contains 10 grams of glucose ($\text{C}_6\text{H}_{12}\text{O}_6$) dissolved in 1 liter of water. Find the boiling point elevation. (K_b for water = $0.512^\circ\text{C kg/mol}$)

Solution:

- Moles of glucose = $10 \text{ g} / 180 \text{ g/mol} = 0.0556 \text{ mol}$
- Volume of water = 1 kg (assuming density of water $\sim 1 \text{ g/mL}$ for simplicity)
- $\Delta T_b = K_b \times m \times i$
- $m = \text{molality} = 0.0556 \text{ mol} / 1 \text{ kg} = 0.0556 \text{ mol/kg}$
- $i = 1$ (non-electrolyte)

$$\Delta T_b = 0.512 \times 0.0556 \times 1 = 0.0285^\circ\text{C}$$

Result: The boiling point increases by approximately 0.0285°C .

Common Challenges and Pitfalls in Numerical Problems

Despite straightforward formulas, students often encounter difficulties. Recognizing these pitfalls enhances problem-solving accuracy.

- Ignoring van 't Hoff factor (i): For ionic compounds, forgetting to multiply by i results in incorrect colligative property calculations.
- Unit mismatches: Mixing grams with liters or molality with molarity without proper conversion leads to errors.
- Assuming ideal behavior: Real solutions may deviate, especially at high concentrations.
- Misinterpretation of data: Failing to note whether the problem involves weight/volume percentages or molar concentrations.
- Sign errors: In colligative properties, the depression or elevation should be correctly assigned.

Best Practices for Mastering Numerical Problems

- Practice Regularly: Routine practice reinforces concepts and improves calculation speed.
- Understand Concepts Thoroughly: Memorize formulas but also grasp their derivations and assumptions.
- Use Dimensional Analysis: Ensures unit consistency and helps catch errors.
- Keep a Formula Sheet: A dedicated sheet for quick reference to formulas and constants.
- Review Mistakes: Analyze errors in previous problems to avoid repeating them.

QuestionAnswer How do you calculate the molarity of a solution when given the mass of solute

and volume of solution? Molarity (M) is calculated using the formula $M = (\text{mass of solute in grams} / \text{molar mass}) / \text{volume of solution in liters}$. First, convert the mass to moles by dividing by molar mass, then divide by volume in liters. What is the method to determine the molality of a solution when given the mass of solute and solvent? Molality (m) is found by dividing the number of moles of solute by the mass of solvent in kilograms: $m = (\text{moles of solute}) / (\text{mass of solvent in kg})$. How can I calculate the mole fraction of a component in a solution? Mole fraction (X) of a component is calculated as the number of moles of that component divided by the total number of moles of all components: $X = n_{\text{component}} / n_{\text{total}}$. How do you find the boiling point elevation of a solution based on solute concentration? Boiling point elevation (ΔT_b) is calculated using $\Delta T_b = i K_b m$, where i is the van 't Hoff factor, K_b is the ebullioscopic constant, and m is the molality of the solution. What is the procedure to determine the osmotic pressure of a solution? Osmotic pressure (π) is calculated with $\pi = i M R T$, where i is the van 't Hoff factor, M is molarity, R is the gas constant, and T is temperature in Kelvin. How do you solve numerical problems involving dilution of solutions? Use the dilution formula: $C_1 V_1 = C_2 V_2$, where C_1 and V_1 are the concentration and volume before dilution, and C_2 and V_2 after dilution. Rearrange to find the unknown quantity. What is the step-by-step process for calculating the percentage by weight of a solute in a solution? Percentage by weight (%) = $(\text{mass of solute} / \text{mass of solution}) \times 100$. Measure the mass of solute and total solution, then compute the ratio and multiply by 100.
