Common Types of Problems and Their Solutions

Understanding how to approach and solve typical problems in Chapter 12 is vital. Below are some

common problem types along with strategies and sample solutions.

1. Calculating Aberrations in Optical Lenses

Problem:

Determine the chromatic aberration of a lens made of a specific glass material when used with incident light of two different wavelengths.

Solution Approach:

- Use the lensmaker's formula to find the focal lengths for each wavelength.
- Calculate the difference in focal lengths to quantify chromatic aberration.

Sample Calculation:

- Given:
- Refractive index $n(\lambda_1)$ and $n(\lambda_2)$ for two wavelengths.
- Lens curvature radii R_1 and R_2 .

- Step 1: Calculate focal lengths for each wavelength:

$$f(\lambda) = \frac{1}{(n(\lambda) - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)}$$

- Step 2: Find the difference:

$$\Delta f = |f(\lambda_1) - f(\lambda_2)|$$

- The larger (Δf) , the more significant the chromatic aberration.

Key Takeaway:

Design choices such as using achromatic doublets can minimize this aberration, and solutions highlight how material properties influence optical performance.

2. Designing an Optical System to Minimize Aberrations

Problem:

Design a lens system that minimizes spherical and chromatic aberrations for a specific application.

Solution Approach:

- Use compound lenses (doublets/triplets) to counteract aberrations.
- Select materials with appropriate dispersion properties.
- Optimize lens radii and thicknesses.

Design Steps:

- Identify Requirements:
 - Desired focal length, aperture size, and wavelength range.
- Initial Selection:
 - Choose lens types (e.g., plano-convex, meniscus).
- Optimization:
 - Use ray tracing software or analytical methods to adjust parameters.

- Aberration Correction:

- Combine lenses with differing dispersions to cancel chromatic aberration.
- Shape lenses (aspheric surfaces) to reduce spherical aberration.

Outcome:

A balanced design with minimized aberrations, supported by calculations illustrating how each parameter affects performance.

3. Resolution Limits and the Rayleigh Criterion

Problem:

Calculate the minimum resolvable detail in an optical system given a specific wavelength and aperture size.

Solution Approach:

- Use the Rayleigh criterion:

$\theta_{\min}$

$$\theta_{\min} = 1.22 \frac{\lambda}{D}$$

where:

- λ is the wavelength,
- D is the aperture diameter.

- Convert angular resolution to linear resolution at a given distance.

Sample Calculation:

- Given:
- $\lambda = 550 \text{ nm}$ (green light),
- $D = 0.1 \text{ m}$,
- Distance $L = 2 \text{ m}$.

- Step 1: Calculate angular resolution:

[

$$\theta_{\min} = 1.22 \frac{550 \times 10^{-9} \text{ m}}{0.1 \text{ m}} \approx 6.7 \times 10^{-6} \text{ radians}$$

]

- Step 2: Find linear resolution:

[

$$\Delta x = L \times \theta_{\min} \approx 2 \text{ m} \times 6.7 \times 10^{-6} \approx 13.4 \mu\text{m}$$

]

Implication:

This calculation sets the limit for the smallest detail the system can resolve.
