## Sample Questions and Expert-Backed Answers

Below, we present representative questions you might encounter on the Chemistry 1151 GPC final exam, along with detailed explanations and correct answers based on curriculum standards. These serve as a benchmark for preparation.

### Question 1: Atomic Structure and Periodic Table

**Q:** Describe how atomic number and atomic mass influence an element's position in the periodic table.

**A:**

The atomic number, which indicates the number of protons in an atom's nucleus, determines an element's position in the periodic table. Elements are arranged in order of increasing atomic number, which also corresponds to the number of electrons in a neutral atom. The periodic table is structured into periods (rows) and groups (columns), reflecting periodic trends in properties such as

electronegativity, atomic radius, and ionization energy.

Atomic mass, on the other hand, is not used to position elements but provides information about isotope distribution and atomic weight. While atomic mass varies among isotopes, the average atomic mass listed in the periodic table reflects the natural isotope abundance.

Key Point:

- Atomic number = position in the periodic table (increases from left to right across periods).
- Atomic mass provides supplementary data but does not influence element placement.

## Question 2: Stoichiometry and Chemical Reactions

Q: Calculate the grams of water produced when 5 grams of hydrogen gas reacts with excess oxygen.

A:

The balanced chemical equation for the reaction is:

Step 1: Calculate molar amounts.

- Molar mass of  $\text{H}_2 = 2.02 \text{ g/mol}$ .
- Moles of  $\text{H}_2 = 5 \text{ g} / 2.02 \text{ g/mol} = 2.48 \text{ mol}$ .

Step 2: Use molar ratio from the balanced equation.

- 2 mol  $\text{H}_2$  produces 2 mol  $\text{H}_2\text{O}$ .
- Moles of water produced = 2.48 mol (since the ratio is 1:1).

Step 3: Convert moles of water to grams.

- Molar mass of  $\text{H}_2\text{O} = 18.02 \text{ g/mol}$ .
- Grams of  $\text{H}_2\text{O} = 2.48 \text{ mol} \times 18.02 \text{ g/mol} = 44.7 \text{ g}$ .

Answer: Approximately 44.7 grams of water are produced.

### Question 3: Gas Laws

Q: A 2.00 L container holds 1.00 mol of an ideal gas at 25°C. What is the pressure inside the container?

A:

Using the ideal gas law:

$$PV = nRT$$

Where:

- $P$  = pressure (atm)
- $V$  = volume = 2.00 L
- $n$  = 1.00 mol
- $R$  = 0.0821 L·atm/(mol·K)
- $T$  = temperature in Kelvin = 25°C + 273.15 = 298.15 K

Calculating:

$$P = \frac{nRT}{V} = \frac{(1.00)(0.0821)(298.15)}{2.00}$$

$$P = \frac{24.45}{2.00} = 12.23 \text{ atm}$$

Answer: The pressure is approximately 12.2 atm.

### Question 4: Thermodynamics

Q: Explain the significance of enthalpy change ( $\Delta H$ ) in chemical reactions.

A:

Enthalpy change ( $\Delta H$ ) represents the heat absorbed or released during a chemical reaction at constant pressure. A negative  $\Delta H$  indicates an exothermic reaction where heat is released, while a positive  $\Delta H$  signifies an endothermic process that absorbs heat from the surroundings.

Understanding  $\Delta H$  is vital because it influences reaction spontaneity, energy efficiency, and practical applications such as heating or cooling systems. Enthalpy changes also help compare different reaction pathways and understand bond energies involved.

Key Point:

- $\Delta H$  provides insight into energy flow during chemical transformations.
