The modeling phase is critical. Accurate representation ensures reliable analysis results.

- Creating the Geometry: Use the built-in drawing tools or import CAD files to model the structure's geometry. For reinforced concrete structures, precise modeling of beams, columns, slabs, and walls is vital.
- Assigning Material Properties:
 - Concrete: Define concrete classes (e.g., C25/30, C30/37) based on project requirements.
 - Reinforcement: Specify steel grades (e.g., B500B), and set parameters for reinforcement bars.
- Defining Sections:
 - Use the section editor to assign cross-sectional properties to members.
 - For slabs and beams, define thickness and reinforcement layers.

2. Applying Loads and Load Cases

Proper load application is essential for realistic analysis.

- Dead Loads: self-weight of structural elements, finishes, fixtures.
- Live Loads: occupancy, furniture, equipment.
- Environmental Loads: wind, snow, seismic forces.
- Dynamic Loads: for structures sensitive to vibrations or seismic activity.

Create load cases for each individual load type and combine them into load combinations following the relevant standards (e.g., Eurocode, ACI).

3. Boundary Conditions and Supports

Define supports accurately to reflect the real-world constraints.

- Support Types:
 - Fixed supports for columns on foundations.
 - Pinned or roller supports for bearing points.
- Boundary Conditions:
 - Set boundary constraints to prevent rigid body motions.
 - Apply initial conditions if necessary for dynamic analysis.

4. Running the Structural Analysis

Once the model and loads are set:

- Execute the Analysis: click on the ?Run? button; Robot will process the model and compute internal forces, deflections, and stresses.
- Review Results: analyze diagrams for moments, shear, axial forces, and deflections.

The software provides detailed visualization tools, including color-coded diagrams and numerical outputs.

5. Reinforcement Design and Detailing

This is the core of reinforced concrete analysis.

- Design Checks:
 - Verify that bending moments, shear forces, and axial loads are within permissible limits.
 - Use the built-in code check modules to compare results against relevant standards.
- Reinforcement Layout:
 - Generate reinforcement bars for beams, slabs, and columns.
 - Define reinforcement ratios and bar diameters.
 - Use the reinforcement editing tools to customize placement according to code and

constructability.

- Reinforcement Detailing:
- Automate reinforcement detailing reports.
- Export reinforcement layouts and schedules compatible with construction documents.

6. Optimization and Code Compliance

- Reinforcement Optimization:
- Adjust reinforcement ratios to achieve economic and constructible designs.
- Use the software's optimization tools to minimize reinforcement volume while maintaining safety margins.

- Code Compliance Checks:
- Ensure that all designs conform to local codes (Eurocode, ACI, BS, etc.).
- Utilize the software's validation features to perform code-specific checks for crack widths, minimum reinforcement, cover, and detailing.
